

Statistics 521: Applied Econometrics II

Spring 2016

Professor: Paul Shaman
Email: shaman@wharton.upenn.edu
Office: 457 JMHH
Telephone: 8-8749

Office hours: MTuTh, 4:30–6, and by appointment

Class hours and location: MW 1:30–2:50, JMHH F92

Teaching Assistant: Bikram Karmakar, bikramk@wharton.upenn.edu

Course web site

Statistics 521 is using Canvas. You can gain access by going to <https://wharton.instructure.com/courses/>. All notes, homework assignments and data sets for the course will be distributed and managed via the website.

Materials

Class notes. As noted above, these will be available on Canvas. I will post notes in advance of the lectures. Each posting will provide material for one or more lectures.

Econometric Analysis of Cross Section and Panel Data, 2nd ed., by Jeffrey M. Wooldridge, MIT Press, 2010. This is the main course text. I expect to cover topics at the end of Chapter 7, in Chapters 8 and 10, in part of Chapter 11, in Chapters 12–16, and in part of Chapter 18.

Mostly Harmless Econometrics, An Empiricist's Companion, by Joshua D. Angrist and Jörn-Steffen Pischke, Princeton University Press, 2009. This is a book you should read carefully in its entirety. It is written in a refreshing and entertaining style. However, don't be fooled—it assumes a good deal of statistical understanding and can be quite challenging.

Mastering 'Metrics: The Path from Cause to Effect, by Joshua D. Angrist and Jörn-Steffen Pischke, Princeton University Press, 2014. This is a sequel to *Mostly Harmless Econometrics, An Empiricist's Companion*. It is written in the same engaging style as *Mostly Harmless* and contains many examples.

Applied Econometrics with R, by Christian Kleiber and Achim Zeileis, Springer, 2008. This is a good reference for R basics and examples of the use of R. I have also posted on Canvas six documents which give R information and instruction.

(Optional) *Econometric Analysis of Panel Data*, 5th ed., by Badi H. Baltagi, Wiley, 2013. This is an in-depth examination of econometric methods for panel data models. Numerous empirical examples are included.

(Optional) *Econometrics*, by Fumio Hayashi, Princeton University Press, 2000. Hayashi's treatment differs substantially from that of Wooldridge. His presentation tends to be more mathematical, and it addresses concepts and topics from time series as it proceeds (we will consider only a few issues from time series). Moreover, Hayashi introduces generalized method of moments (GMM) estimation early in his presentation, noting that ordinary least squares and two-stage least squares are special cases. If your interests are mathematical, I encourage you to do some reading in Hayashi. It is instructive and very helpful to see an alternative presentation of econometrics.

Journal articles. I will use several journal articles for notes and discussion, and for homework assignments.

Software

The R package will be used in lectures and for homework. R is free software and is available at www.r-project.org.

Course overview

The aims of this course are to study basic econometric techniques. The emphasis will be upon the understanding and use of econometric methodology, and the written communication of the results of data analysis. Topics we will cover include panel data models, system estimation with instrumental variables, random effects and fixed effects models, M-estimation, nonlinear least squares, quantile regression, maximum likelihood, the generalized method of moments, binary and multinomial response models, and regression models for count data. We will examine the mathematical and statistical foundations of the methods, as well as their application. As in *Applied Econometrics I*, we will employ linear algebra extensively throughout, and we will discuss and apply results from probability and statistical theory.

Course requirements

There will be about five homework assignments. These will include theoretical exercises and involve the analysis of data and interpretation of the findings, and the presentation of well-organized and clearly written reports. The homework is designed to teach and to give experience in the use of econometric methodology. You are encouraged to consult with each other in doing the homework, and also to contact me for help. ***You must submit your own proofs, calculations, and your own writeup. Files should not be shared.*** Homework must be submitted by the due date specified for the assignment.

There will be a final project. This will involve replicating the analysis presented in an empirical paper, and possibly presenting further analyses of the data set used in the paper. As an alternative, you may use a data set of your own choosing and carry out an original analysis, using your own research. A major goal of this exercise is organization and presentation of a carefully written report. Prior to starting the project, you will submit a brief (not more than one page) project proposal for my review. ***This proposal is required.***

There are no examinations. The course grade will be calculated as 80 per cent homework and 20 per cent final project.

Calendar

There are 28 classes.

The first class is Wednesday, 13 January.

There is no class Monday, 18 January (Martin Luther King, Jr. Day).

The drop period ends 19 February.

There are no classes during the week of 7 March (Spring break).

The withdrawal deadline is 25 March.

The last class is Wednesday, 27 April.
